Report generated on: 21/10/2026 17:04

How to interpret this report:

1. look at the column called [Supported Versions]: the installed version of the customer is printed in bold.
2. Underneath you see all the versions up to the most recent official release.
3. Now look at the contents of the [Contractual Maintenance] column.
4. Next to each version, you will see if that version is still supported (green) or not (red).
5. If there is a date printed, this means that it is supported until that date.

Example:

If the latest installed version is corresponding with a red field, you need to move down the stack of newer releases until you reach a green field. If there is no date inside, you are safe until a new release comes out; in case there is a date printed, that will be the maximum supported date. We advise to install at least a version that has no expiration date.

The concept of [Contractual Maintenance] means that you should traverse the stack of officially supported versions until you reach the bottom. This is the most recent version released by DEV. Contractual Maintenance means that this version is supported, the previous version (so move one version upward the stack - if any), the second previous version (move again one more version upward in the stack - if any) but that this second previous version is only supported X months after the release date of the most recent released version. The version of X can be found in the leftmost column (#months).

Attention:

The most recent released version is something that is not imported automatically in this report!
Should you notice as a user of this report that the most recent version is outdated, please add then this version in table SD_eXimius_releases (sqlsrv:server=159.104.69.47;Database=Jira_reporting_DATA)
At this moment we have **6.2.1** as most recent official production release in our database.
